

HOW TO ADD THE **NEW COMPONENTS**

This adds 45 new section components to your Clark Pacific Figma file. **It doesn't change anything you've already done.** Your pages, your edits and your existing components stay as they are. You'll copy the new ones onto a page of their own, and after that you can use them anywhere.

About 20–30 minutes

9 steps

Fully undoable (Step 1)

WHAT YOU'RE GETTING

FIGMA FILE

Clark Pacific 2.5 Additions

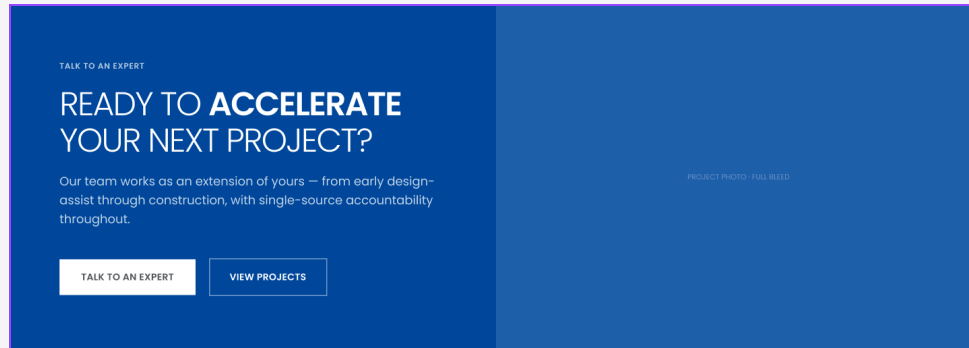

A separate file with the 45 components, already built as Figma components, each with a yellow dev note beside it. You copy from this file; you don't work in it.

DOCUMENT

Figma 2.5 Dev Notes

For your developers. Explains how every module behaves (accordions, carousels, filters), including the ones already in your file.

❖ 2.5 / CTA Decision Panel / Content left · Blue

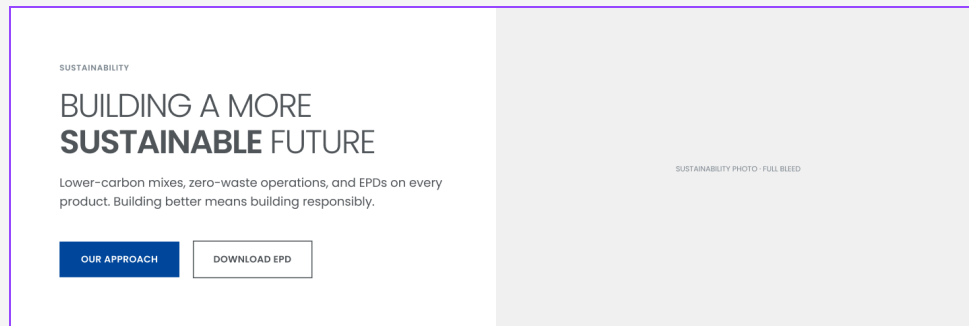

DEV NOTE · CTA Decision Panel / Content left · Blue

CTAs · a25-cta-decision-panel-content-left-blue

Dimensional CTA — headline + value statement + project image + one primary action. Six orientations: three content-left (image right) and three content-right (image left), across Blue / Dark / White-Light surfaces. Button: white or blue fill per surface; no white text on orange.

• Buttons: Primary darkens to #003DB4 on hover; outlined buttons get a 12% fill of their outline colour.

❖ 2.5 / CTA Decision Panel / Content left · White

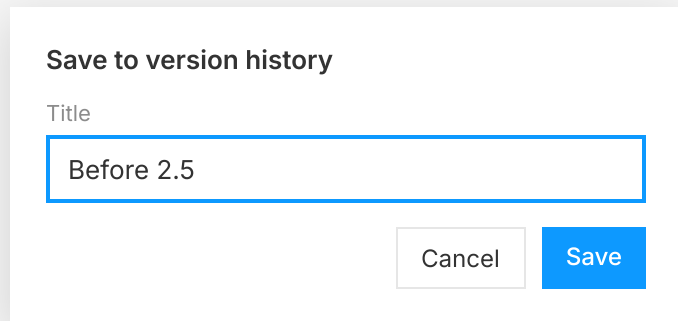

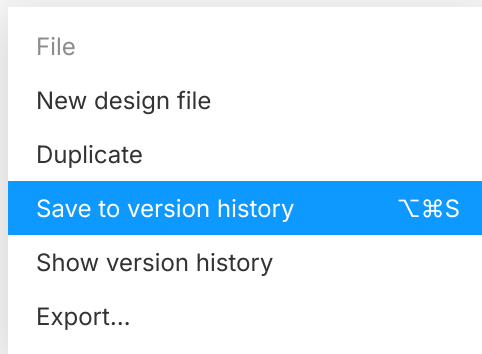

The 2.5 Additions file, page **Components · 2.5 Additions**: each component (purple outline = it's already a component) with its yellow dev note on the right.

THE THREE RULES

1. Paste onto the **new page** only, never onto your existing Components page.
2. Keep each one as its **own component**. Don't merge it into an existing one.
3. **Don't edit your existing components**. If something looks off, send it to Nathan instead.

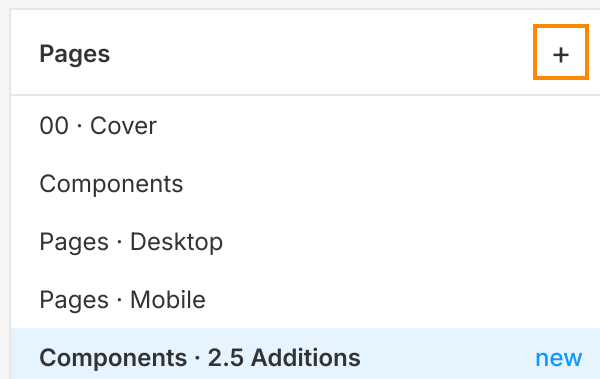

01 SAVE A BACKUP VERSION

In your **Clark Pacific** file, click the file name at the top of the left panel, then **File → Save to version history**. Title it **Before 2.5** and click Save. This is your safety net: if anything goes wrong, Step 9 takes you straight back here.

02 ADD A NEW PAGE FOR THEM

Still in your file, find the **Pages** list at the top of the left panel. Click the **+** and name the new page **Components · 2.5 Additions**. Everything you paste in the next steps goes here, away from your existing work.

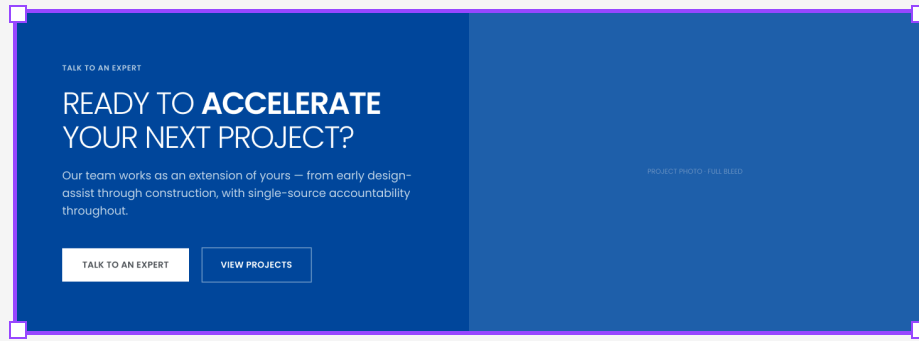

Your page names may differ. That's fine; just add the new one.

03 COPY A COMPONENT FROM 2.5

Open the **Clark Pacific 2.5 Additions** file. Each component has its name printed above it, starting with **2.5 /**. Click the component (not the yellow note) so a **purple box** surrounds the whole thing, then press ⌘ C.

❖ 2.5 / CTA Decision Panel / Content left · Blue

Dev note
Copied separately in
Step 6.

Tip: selecting. If a click selects just a headline or button inside it, click the name in the **Layers** panel on the left instead. The top-level layer named "2.5 / ..." is the whole component.

Tip: several at once. Hold **Shift** and click several names in Layers to copy a batch. Batches of about five are easiest to check.

Only copy from Components · 2.5 Additions. The file's other page, **Building blocks (from 2.0)**, holds copies of the buttons, text links and icons these components use. You don't need to copy it.

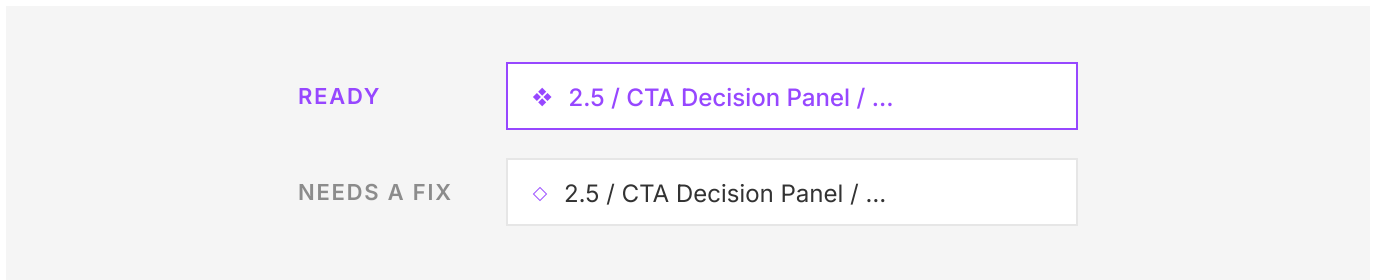

04 PASTE ONTO THE NEW PAGE

Go back to your file and click **Components · 2.5 Additions** in the Pages list. Check the page name is highlighted, then click an empty spot on the canvas and press ⌘ V. Stack them top to bottom with some space between; the order doesn't matter.

Before every paste, look at the Pages list. If **Components** or a Pages page is highlighted, switch to the 2.5 page first.

05 CHECK IT CAME IN AS A COMPONENT

There's nothing to convert: each one is already a component. With the pasted one selected, look at its name in **Layers**. A **purple four-diamond icon** means it's ready. If you see a hollow diamond instead, it came in linked to the 2.5 file: right-click → **Detach instance** (⌘ ⌘ B), then right-click → **Create component** (⌘ ⌘ K).

Check the name. In Layers it should read exactly like the label above the component in the 2.5 file, starting with **2.5 /**. If it doesn't, double-click the name in Layers and type it in. The slashes group your new components into folders in the Assets panel.

Don't group them. Never choose "Create component set" or "Combine as variants"; each one stays its own component.

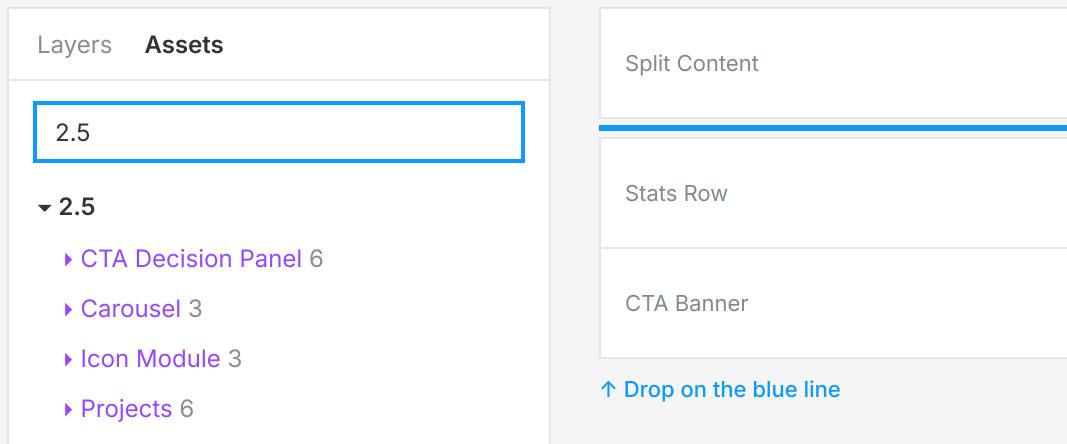

Styles named "Flagged/2.5". Some colours and type sizes come in with names like *Flagged/2.5 · #FFFFFF 72%*. They're values from the library that aren't in the 2.0 system yet. Leave them as they are; your developers and Nathan will decide whether to keep or replace them.

06 BRING THE DEV NOTES ALONG

Copy the yellow card beside each component and paste it next to that component on the 2.5 page. **Leave the notes as plain frames.** Don't make them components. They're there so your developers see the behavior next to the design. Eleven components are tagged **INTERACTIVE**; for those, the note matters most.

07 USE ONE ON A PAGE

Open the desktop page you want to change. In the left panel, click **Assets** and type **2.5** in the search. Drag the one you want onto the page and drop it on the **blue line** that appears between two sections.

About Swap Instance. Right-click → Swap instance works too, but it **replaces** the section, and text or photo labels you've edited in it won't come along. On sections you've already worked on, drag the new one in beside it, copy your text across, then delete the old one.

08 DO & DON'T

DO

- ✓ Paste only onto Components · 2.5 Additions
- ✓ Check each one shows the ❖ component icon
- ✓ Keep the "2.5 /" at the start of names
- ✓ Drag new ones onto pages from Assets
- ✓ Edit text and photo labels on a page as usual

DON'T

- ✗ Paste onto your existing Components page
- ✗ Use "Combine as variants" or "Create component set"
- ✗ Resize, re-layout or rename existing components
- ✗ Detach instances on your pages
- ✗ Turn the yellow notes into components

09 IF SOMETHING GOES WRONG

For a single slip, press ⌘ Z to undo. For anything bigger: **File** → **Show version history**, find **Before 2.5**, click the **...** beside it and choose **Restore this version**. Everything goes back to how it was before Step 1. Then message Nathan.
